

HAZARD MANAGEMENT SERVICES

3D Safety Services Pty Ltd specializes in workshop management and monitoring services for hot work areas. Our systems assist our clients to achieve compliance to the relevant State based Occupational Health and Safety Regulations.

Our services include

- Hazard identification for welding equipment
- Inspection and testing of welding equipment
- Scheduled auditing of all welding equipment
- Assessment of work practices
- Assessment of personnel

Our focus is on the three main areas that contribute to workplace accidents:

PEOPLE

Eighty percent of all hot work accidents are caused through human error.

Operators often receive very little training in the operational requirements of the welding equipment they use and are unaware of the catastrophic effects the misuse of the equipment can lead to.

Our training systems assess operators to determine their level of competency.

PLANT

Our systems provide for all plant used in the workshop to be individually identified and any activity in relation to that plant is recorded on a plant register.

Our inspection of plant includes

- Testing and labelling of plant for compliance to Australian Standards
- Identification tags on all equipment
- Customised reports for each plant at each location

PROCESSES

When equipment is used outside of its capacity, it is a breach of the manufacturer's guidelines and can lead to 'Highly Likely' risks of injury and death. The solutions are simple effective and in most cases will reduce operating costs.

We specialise in creating a safe work environment by identifying unsafe and incorrect processes and recommending solutions which work.

BENEFITS

We have numerous examples of cost saving derived from the correct implementation of a scheduled monitoring and management system.

QUOTATION

If you would like to discuss implementing a program for your workshop or organisation please contact us on 1300 663 195 and we will arrange for an on-site quotation.
